

1) Controllers/

SuggestedController.js – Handles logic for creating and retrieving nutrition suggestions for users.

UserController.js – Manages user-related actions like registration, login, and fetching user profiles.

2). db/config.js

MongoDB connection setup using mongoose.connect().

3) middlewares/

authMiddleware.js – Verifies JWT tokens to protect routes and ensure only authenticated users access certain endpoints.

4) models/

Suggestion.js – Mongoose model defining the schema for storing nutrition suggestions in the database.

User.js – Mongoose model defining the schema for user data including email, password, and other profile info.

5) routes/

suggestionRoute.js – Defines API endpoints related to nutrition suggestions and links them to their controller functions.

userRoute.js – Defines user-related API endpoints (e.g. register, login) and connects them with user controller functions.

6) utils/

suggestNutrition.js – Contains the core logic to generate personalized nutrition suggestions based on user input.

Entry Point – server.js

Initializes Express server.

Connects to MongoDB via db/config.js.

Uses middleware (express.json(), cors, etc.).

Registers all route files.

Listens on a specific port (e.g., 8000).
