Nutrition Assistant App

A full-stack MERN (MongoDB, Express, React, Node.js) web application for personalized nutritional guidance and meal tracking.

🌟 Features

- **Authentication** — Register, login, JWT-protected routes
- **Meal Logging** — Log breakfast, lunch, dinner, snacks with food items & macros
- **Nutrition Analytics** — Calorie trends, macro breakdown, BMI & TDEE calculator
- **Recipe Manager** — Create, browse, and filter healthy recipes
- **Profile & Goals** — Set calorie goals, activity level, dietary restrictions
- **Dashboard** — Daily summary with charts and today's meal overview

Setup Instructions

Prerequisites

- Node.js v16+
- MongoDB (local or MongoDB Atlas)

1. Clone / Extract the project

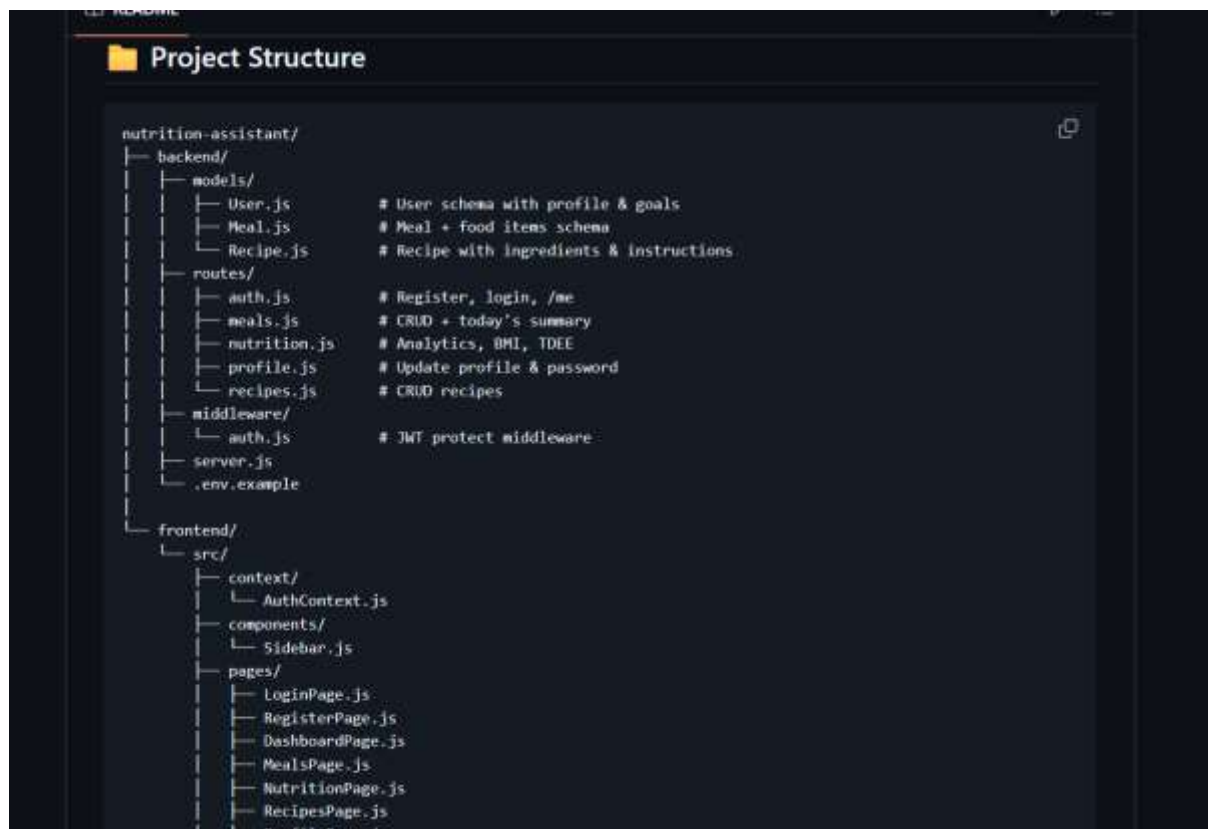

```
cd nutrition-assistant
```

2. Backend Setup

```
cd backend
npm install
cp .env.example .env
```

Edit `.env`:

```
PORT=5000
MONGO_URI=mongodb://localhost:27017/nutrition_assistant
JWT_SECRET=your_super_secret_key_here
NODE_ENV=development
```

Nutrition

Method	Route	Description
GET	/api/nutrition/macros	Today's macro breakdown
GET	/api/nutrition/summary	Weekly summary (?days=7)
GET	/api/nutrition/bmi	Calculate BMI
GET	/api/nutrition/tdee	Calculate TDEE

Recipes

Method	Route	Description
GET	/api/recipes	List recipes (search/filter)
POST	/api/recipes	Create recipe
GET	/api/recipes/:id	Get recipe
PUT	/api/recipes/:id	Update recipe
DELETE	/api/recipes/:id	Delete recipe

Production Build

```
cd frontend  
npm run build
```

Then serve the `build/` folder with Express or any static host (Vercel, Netlify, etc.)

Notes

- This app is designed to **complement** professional dietary advice, not replace it.
- Calorie and macro data must be entered manually — consider integrating a food database API (e.g., USDA FoodData, Nutritionix) for auto-lookup.
- For production, use MongoDB Atlas and set strong environment variables.
