

USER FLOW :

Userflow Explanation for Customer Role in a Nutrition Assistant Application:

1. User Registration & Profile Setup:

The customer opens the app and signs up using their details.

During registration, they provide age, weight, height, gender, and activity level.

After registration, they can access their profile and update these details anytime.

2. Food Consumption Logging:

On the home screen or dashboard, the user sees an option to add food.

They search for food items from a database.

They select the item and input the quantity or serving size.

This gets saved in their daily log or diary.

3. Diet Plan Creation:

The user navigates to the “My Diet Plan” section.

They can create a new plan by choosing their goals (e.g., weight loss, maintenance).

They select start and end dates and preferred food types or restrictions.

The plan is saved and tracked daily.

4. Nutritional Information Review:

The app displays the nutritional breakdown of each logged item (calories, protein, carbs, fats).

Users can review total daily intake or per-meal breakdown.

This helps them understand what they are consuming.

5. Following Recommendations:

Based on input data and goals, the app provides personalized tips or recommendations (e.g., increase protein intake).

Users view this guidance on their dashboard or notification area.
